

Rethinking Respite for People Affected by Dementia

Annex 2: Bibliography

This literature review was undertaken by the University of Worcester, Association for Dementia Studies between October 2018 and December 2018.

Stage 1: A broad-brush search was conducted within the Open University and the University of Worcester libraries and Google/Google Scholar to assess the lay of the land in terms of academic literature relating to respite. The starting point for the literature review was a range of systematic reviews from the last five years, as these reviews reflected the literature over a period of around 20 years. This was followed up with a wider search outside of the reviews for literature over the last five years that might not have been part of those systematic reviews. The following terms were included in the literature search: Respite care; dementia; person with dementia; carer; learning disabilities; replacement care; autism; paediatrics; frailer older people.

Stage 2: During Stage 1 it became apparent that a number of countries are pioneering in the area of respite in terms of their approaches to policy and practice. These international areas of good practice were identified, and consequently, Stage 2 of the literature review focused on policy, reports and examples of practice within these countries. This included literature relating to both dementia and other disabilities and conditions, such as learning disabilities, autism and frailty. The search was carried out in the databases as described above and using the same search terms but with the addition of a specific country. References were collated using the Mendeley reference management software package.

The references have not been translated into Welsh as the documents are not available in Welsh translation.
